

Jeffrey Macy

APPLYING FOR — Senior Software Engineer, Front End Development · **Microsoft**

🎓 A.A.S. Web Design, Glendale Community College · B.S. Programming & Data Analytics (*in progress*) |

Web & Applications Developer, **Arizona State Legislature**

What drew me to this posting is the word "shell." I've already built one, at much smaller scale: the shared theme architecture behind the Arizona House and Senate websites, where the Senate site is nested inside the House theme so both inherit one system and diverge only where the chambers actually differ. That's the same problem a platform shell solves — one architecture, multiple consuming surfaces, deliberate points of divergence — just applied to state government instead of Fabric.

Day to day, I write React, TypeScript, and Tailwind against a WordPress back end that pulls structured content — bills, legislator profiles, committee agendas, floor votes — out of a SQL Server database and into reusable views shared across both sites. I built the custom-fields and template layer, 15+ templates per site, that lets non-technical legislative staff publish without touching code, and I enforce WCAG AA accessibility at the design-token level rather than auditing for it after launch. Both sites are live, public, and serving real legislative data today.

Outside that role I run a freelance practice building React and Supabase applications for small businesses, and on my own time I've built MCP servers and clients from scratch for an AI coding assistant on Anthropic's SDK. I test with Playwright and Vitest as a matter of habit, not because a project template told me to. I'm looking for a team working at a scale my current projects haven't put in front of me yet, and Fabric Platform Shell is exactly that.

HOW I MATCH THE ROLE

PLATFORM / SHELL ARCHITECTURE Built a nested-theme shell serving two government sites from one design system	REACT / TYPESCRIPT DEPTH Daily production use across government and freelance client work since 2023
CODE QUALITY & TEST COVERAGE Playwright and Vitest in regular use; WCAG AA enforced at the token level	MULTIPLE CONSUMING SURFACES One theme, two production sites, diverging only where they must
HIGH-PERFORMANCE UX INSTINCT Text-to-speech feature shipped unrequested because it made the product better	OWNERSHIP ACROSS THE STACK Structured content from SQL Server to rendered page, template layer included

FULL STACK

React 18

TypeScript

JavaScript

Tailwind CSS

WordPress

SQL Server

C#

Node.js

Playwright

Vitest

Git / GitHub

I'm relocating to Redmond for this role. [azhouse.gov](#) and [azsenate.gov](#) are both live if you'd like to see the shell architecture directly before we talk.
