APPLYING FOR

Software Engineer I (Remote Eligible) · [Smartsheet](#) A.A.S. Web Design, Glendale Community College · B.S. Programming & Data Analytics (*in progress*) |Web & Applications Developer, **Arizona State Legislature**

What caught my attention in this posting is the line about wanting engineers who "want to get good" at using AI to write better code, catch bugs faster, and troubleshoot smarter. That's not a box I'm checking to match a job posting -- it's already how I work. At the Arizona State Legislature I use AI-assisted workflows daily to move faster on implementation, testing, and debugging, while still owning the code review and production quality myself. On my own time I went further and built an AI coding assistant on Anthropic's SDK, with a structured-agent pipeline and MCP servers and clients I designed from scratch -- so I understand the tooling at the API level, not just as a chat interface.

On the engineering side, I build and maintain full-stack production software for two government sites: React and TypeScript on the front end, a structured content pipeline out of SQL Server on the back end, REST APIs connecting the two, and WCAG AA accessibility enforced at the design-token level rather than audited in after launch. I also run a freelance practice building full-stack apps with Supabase and Stripe integrations, so I've shipped and supported real production systems beyond my day job. I haven't worked with Kotlin or Kubernetes specifically, but the underlying discipline -- REST API design, distributed systems thinking, balancing build-vs-refactor-vs-simplify -- transfers, and I pick up new stacks fast.

I'm drawn to Smartsheet's framing of uniting human teams with AI agents rather than just bolting AI onto existing workflows. That's the actual interesting problem in software right now, and it's the one I've been building toward on my own before there was a job posting for it.

HOW I MATCH THE ROLE

AI-ASSISTED DEVELOPMENT, DAILY Use AI tooling in production workflows, not just as a novelty	BUILT AI TOOLING, NOT JUST USED IT MCP servers and clients on the Anthropic SDK, from scratch
REACT / TYPESCRIPT FULL-STACK Daily production use across two government sites	REST API DESIGN Structured content pipeline from SQL Server into reusable views
OWNERSHIP OF SCALABLE SYSTEMS Three government sites, 15+ templates each, serving live public data	PRACTICAL EXPERIENCE OVER PEDIGREE Freelance since 2023, solo scoping through delivery, every client

FULL STACK

[@anthropic-ai/sdk](#)[@modelcontextprotocol/sdk](#)[React 18](#)[TypeScript](#)[Node.js](#)[SQL Server](#)[REST APIs](#)

[Supabase](#)[Stripe](#)[Git / GitHub](#)[Playwright](#)

I'm remote in Arizona and eligible to work in the U.S. Happy to walk through the Legislature build or the MCP server architecture in an interview -- both are real systems in daily use, not portfolio pieces.
